HENCO 1040 flash and stain rust remover – Aluminum

Problems with aluminum

Softer metals like aluminum can be a challenge to clean, without damaging the metal, with the existing products on the market. Aluminum is a very light and soft metal and should be treated and cared for the same way as it is.

Aluminum tends to pick up flash and stain rust easily, which makes it important to remove before further damage happens to the surface. Corrosive products used with aluminum can create stains, that make the surface look damaged and has to be changed out.

These pictures show an aluminum gate that is full of stains and rust.

*Remove flash rust and stains the
green way with our new product
HENCO 1040*

We spray the surface with water and apply HENCO 1040 right after. Let it sit for 15 min before working on it.

HENCO-1040 is a 100 % environmentally safe product that we have created for softer metals like aluminum.

After 15 min use a sponge with a rough side. You should see immediate removal of the rust and stains.

after the sponge has been used on the area with HENCO 1040 apply water and rinse the rust down.

Where can the problem be found?

- High rise buildings
- Window frames
- Trains
- Gates
- Un/Loading ramps
- Ships
- And many more
